

JavaScript Assignment Day 1

1. Even or Odd Number

Problem Statement:

Create a variable named number. Check whether the number is divisible by 2. If it is divisible by 2, print 'Even Number'; otherwise print 'Odd Number'.

Example:

Input: number = 12

Output: Even Number

Input: number = 15

Output: Odd Number

2. Positive, Negative, or Zero

Problem Statement:

Create a variable num. Determine whether the number is positive, negative, or zero using conditional statements.

Example:

Input: num = 25

Output: Positive

Input: num = -10

Output: Negative

Input: num = 0

Output: Zero

3. Pass or Fail

Problem Statement:

Create a variable marks. If marks are 40 or above, print Pass. Otherwise, print Fail.

Example:

Input: marks = 65

Output: Pass

Input: marks = 30

Output: Fail

4. Voting Eligibility

Problem Statement:

Create a variable age. Check whether a person is eligible to vote. A person can vote only if age is 18 or above.

Example:

Input: age = 20

Output: Eligible to Vote

Input: age = 16

Output: Not Eligible to Vote

5. Largest Between Two Numbers

Problem Statement:

Create variables a and b. Compare both numbers and print the largest one. If both numbers are equal, print 'Both numbers are equal'.

Example:

Input: a = 45, b = 67

Output: 67 is larger

Input: a = 50, b = 50

Output: Both numbers are equal

6. Salary Bonus Calculator

Problem Statement:

Create variables salary and experience. Give 20% bonus if experience is 5 years or more, 10% bonus if experience is 2 to 4 years, otherwise 5% bonus. Print bonus amount and final salary.

Example:

Input: salary = 50000, experience = 6

Output: Bonus = 10000, Final Salary = 60000

7. Simple Calculator

Problem Statement:

Create variables num1, num2, and operator. Perform addition, subtraction, multiplication, or division based on the operator value.

Example:

Input: num1 = 20, num2 = 5, operator = '*'

Output: 100

Input: num1 = 20, num2 = 5, operator = '/'

Output: 4

8. Temperature Checker

Problem Statement:

Create a variable temperature. Categorize the temperature as Very Hot, Hot, Pleasant, or Cold.

Example:

Input: temperature = 42

Output: Very Hot

Input: temperature = 25

Output: Pleasant

9. Shopping Discount System

Problem Statement:

Create a variable purchaseAmount. Apply discounts based on the purchase amount and print original amount, discount, and final amount.

Example:

Input: purchaseAmount = 12000

Output: Discount = 20%, Final Amount = 9600

10. Grade Calculator

Problem Statement:

Create a variable percentage. Assign grades according to the percentage range and print the grade.

Example:

Input: percentage = 92

Output: Grade A+

Input: percentage = 75

Output: Grade B

Bonus Challenge: ATM Withdrawal System

Create variables balance and withdrawAmount. Check whether withdrawal is possible. If sufficient balance is available, deduct the amount and print the remaining balance. Otherwise print 'Insufficient Balance'.

Example:

Input: balance = 15000, withdrawAmount = 5000

Output: Transaction Successful, Remaining Balance = 10000

Input: balance = 3000, withdrawAmount = 5000

Output: Insufficient Balance
